Best app for ux design android. What is the best design app for android. Ui ux design app for android. Do ux designers make apps. Ux design app free android. Best ui design app for android.

Google Play Instant provides a new way for users to consume apps. These apps, called instant apps, are native Android apps, but they run without being installed on the device. Each instant app has a corresponding version that users can choose to install. Because of the unique way that users interact with them, instant apps should observe some specific user experience practices. This guide presents guidelines for how to create a positive user experience in an instant app. We strongly recommend that you use material design principles when you design your instant app. For more information about how to apply material design to an app, see Material Design for Android. We've also provided additional guidelines specific to gaming apps. For more information, see the UX best practices for games on Google Play Instant. Figure 1. The "Try Now" button that's shown for an instant app In order for your app or game to have a Try Now button on the Play Store, or to appear in the Android launcher, it needs a default main activity. Users who enter your app from the Try Now button or from the launcher don't have the context of a deep link or specific content they're trying to access. Therefore, you should provide a place for them to browse and discover your app's functionality. It's also worth making sure that your app's name is prominently displayed on the screen. Because users sometimes click on a link to your app without much context, they might not know what your app's name is. Figure 2. A website banner directing users to an instant app Links to apps and games on Google Play Instant open immediately when possible. Otherwise, these links fall back to opening in a browser. By Linking to Google Play, you can change the fallback scenario to go to the Play Store instead. This strategy can be useful if you want to direct users to download your app if they cannot open the app right away and you don't want them to use your app on the web. As an alternative strategy, you can use banners on your website to open your app directly instead of having to send users to the Play Store first. This strategy is shown in Figure 2. Allow users to complete their task When advertising a feature to users in your instant app, ensure that users can use the feature without having to install the app. Avoid asking users to install the app so that they can accomplish what they want to do. The main click-through action of a page in the app should never trigger an installation prompt. Figure 3. Allow users to complete a specific task without prompting them to install the app. Provide as much functionality as possible without requiring users to sign in or register for a service associated with your app. Wait until users try to use a feature that requires authentication before you prompt them to sign in. Users perceive sign in prompts as less intrusive if they immediately see the benefit for signing in. For example, consider a photo sharing app that requires users to log in when launched. To improve the user experience, the app now provides features users can use without logging in, such as browsing the most popular publicly-shared photos and editing the photos on their devices. When the user wants to share their photos with friends, the app prompts them to sign in. Figure 4. Avoid unnecessary sign-in prompts. When users install the app, make sure that you transfer their stored app state to the app using cookies or local storage. Users should be able to pick up where they left off in your app, as depicted in Figure 5. Figure 5. Restore user state after installation The instant app launch experience incorporates app branding, app title, and app launcher icon. Don't create additional splash screens of your own, as those seem redundant to users. Figure 6. Google Play Instant framework provides a launch experience for your app. The Up button navigates upward in the app's navigation stack until the user reaches the app's home screen. The Back button navigates in reverse chronological order through the history of recently viewed screens. While the Up button ensures the user remains in your app, the Back button may take the users back through recent screens outside of your app. In other words, Pressing the Up button shouldn't ever exit the app. For more information about how to design navigation with the Back and Up buttons, see Designing Back and Up navigation. Figure 7. Navigation is key. The UI of your instant app should be identical to the UI of an installed version. Don't change your design and UI in the instant app. Figure 8. Keep a consistent UI between the installed and instant versions of your app Smart Lock for Passwords on Android is a password manager across Chrome and Android. Smart Lock also automatically signs users in on subsequent visits. To make authentication easier for users, provide support for Google Smart Lock in your instant app. Figure 9. Use Smart Lock for authentication. Use install buttons strategically by making them part of your app's user interface. Use the Material Design "get app" icon and the label INSTALL for the installation button. Don't use any other labels like "Get the app," "Install the full app," or "Upgrade." Never use a banner or other ad-like technique for presenting an installation prompt to users. Figure 10. Use installation buttons strategically Implicit installation prompts are links in the instant app that don't do anything other than launch an installation prompt. These implicit installation prompts might occur where you have functionality in the installed version of your app that the instant version doesn't have. Don't have more than 2-3 implicit installation prompts in your app. When using an implicit installation prompt, make sure to provide context and information about the feature that triggered it. Give users a reason why they might want to install the app. Note: The main clickthrough action or button on a screen must not raise an implicit installation prompt. Figure 11. Limit the number of implicit installation prompts. When converting your app to an instant app, you may have portions of your instant app's UI that link to other feature modules of your app. Remove any such sections from the instant app. Figure 12. Remove non-functional parts of your app. If purchases in your instant app aren't supported by Google Play Billing and you don't have the user's payment information on file, you can use another payment API, such as the Google Pay API. The Google Pay API allows you to offer purely offline payments, like cash on delivery, and to store gift cards in your instant app. Figure 13. Payments workflow using the Google Pay API Links to third-party offerings and content can open in a Chrome custom tab or browser. They can be rendered using a WebView when the requested resources are provided through HTTPS protocol. Your own offerings should not link out to the browser but rather stay within the instant app, using a WebView if necessary. All network traffic from inside the instant app must use HTTPS protocol. Within the instant app, you should clearly define what functionality your app provides and what functionality is provided from an external source. Figure 14. Open external links that you don't control in the browser. Since instant apps don't provide an address bar for users to copy the URL, provide a "share" action within your app that allows users to share your instant app's URL. Figure 15. Help users share your instant app. Additional resources For more information about creating high-quality instant experiences, consult the following resources. CodeLabs Seamless Sign In with Smart Lock Peter Martinez updated on 2020-09-25 17:19:49 To design a good android UI design, you need to use the best tool. There are a lot of tools you find online you can apply during the process, but they do not work the same way. Before you decide on which to use, you should take time to look at their pros and cons to make a more informed choice. To create the best android UI design, you need to get a tool with the best and easy to use features to help you complete the task fast. Here are the top tools you can use for the designing process. Top 6 Android UI Design Tool 1. Wondershare Mockitt This tool is the best android UI design tool you can use for the best results. It is an online tool that is easy to use even for those who have never engaged in designing. The tool allows for prototyping for a wide range of platforms including Android, PC, Iphone and many others. It also makes it possible for you to customise the device as you need. Designers enjoy a free and convenient environment. It has a plenty of icons and widgets you use to create the android UI fast. They include image, text, icons, material design library, video, map and others. It is also possible for you to customise the widgets and use in the future. It has a sketch plugin that helps you synch with your sketch files and link the screens fast. There is also a shareable URL and QR code that makes it easy for you to share your design with other people. This gives them the opportunity to preview and give suggestions for improvement. The tool also allows for real time collaboration, allow comments, color picker, current screen colors, global colors and many others that help you come up with an android UX design. Sketch is an easy to use android UI design tool that makes the designing process more efficient and simpler. It simplifies the main features that are used in Illustrator and photoshop and is designed specifically for UI/UX design. In the past, during sketch designing, one had to change between Illustrator and photoshop to use features such as photo effects and vector. Sketch has eliminated this issue, as it makes it possible for you to focus more on UI/UX design to get the best from the android UI design. Another great feature offered by Sketch is that it allows you to install plugins. The plugins helps you save time as you do the designing. Sketch is an easy tool to understand even for beginners. It is rich in UI centric features including layout setting, grid guides text style, layer and many others that make the designing process easy. The tool also allows you to wireframe your UI and even design for many other devices. 3. Invision App This is another android UI design tool for designers. Instead of paying attention on issues such as sketch, the tool makes it possible for you to create mockups for your design. This means it makes the fixed prototype a more interactive one. You can use it to add gestures, animations, interactions, transition among others. Invision App also makes it possible for you to upload your work from several other tools including sketch or adobe photoshop. Another factor that makes it a great tool to use for android UI design is that it allows for fast prototyping. It makes it possible for you to let others know how your design with interact. The design tool also supports communication and collaboration between clients and teammates. Other people can give comments for improvements or even begin discussions. Other features you find in the tool include instant updates, live share and many others. With the tool you can complete your Android UX design that offer value to the end users fast. 4. Marvel App Marvel is a tool that makes it easy for designers to create, wireframe and prototype. The tool makes it possible for you to add interactions to the User Interface works too. Compared to most of the other android ui tools used, it is easy to use because of it has well designed and intuitive interfaces. The other thing is that the tool is compatible with adobe photoshop and sketch. However, you need to add plugins before. Another feature that makes marvel one of the best android UI design tool is that it also allows for collaboration among team members and other stakeholders. This means that you can provide or receive feedback, and also share ideas easily without putting a lot of efforts on the prototype. Everyone is involved very closely in the workflow. The other benefits you get by using the tool for your android UI design is that it is easy and fast to set up. You can also design several types of screens. Besides you can preview your design and find out how the end users will see it. 5. Figma Figma is a top design tool most designers also prefer to use in the modern times. It has several functions and features that make the designing process easy and fast. Figma makes it possible for designers to collaborate. This means that everyone who is involved in the android studio UI design can comment, edit and provide feedback. The collaboration feature is available in both prototyping and design modes. All those involved can understand what is happening with the design at any given time. Figma allows you to control all versions by giving them names and adding descriptions. The tool also has a design system that has your design project component library. This makes it possible for you to access and download all design elements efficiently. Its features are not complicated, this even those entering into the designing field can use it more effectively. 6. Zeplin Zeplin is another android UI design tool that makes it easy to create a design fast with real collaboration. The tool makes it easy for easy collaboration between the design and development team. It aims to bring together different teams and mindsets together. With its rich features you find it easy and efficient to use during the designing process. Zeplin makes it possible for you to export designs from most of the other tools including adobe photoshop, sketch, Figma, adobe XD with less helps from plugins. In addition to this, the tool also helps in generation of development resources instantly and turn UI works into specs and guidelines. This makes it easy for the development team to generate code snippets. The handoff process occurs quickly and more conveniently. The tool also has a critical feature of tool is arranging, grouping and tagging a wide range of related artboards together. What is UI Design in Android and Tips to Do Good UI Design Tool UI Design in Android involves creating a design with anticipation on what the end users will require to do and ensuring that the UI design has elements are easy to understand, access and use. Here are tips to do good UI design. Choose the right UI elements Android ui design end users get familiar with elements working in a specific way. Thus, you should be consistent and be predictable as you make your choices and the layout. By doing this, you enjoy efficiency and satisfaction. Ensure the interface is simple A good interface is almost invisible to the users. Thus, as you do the designing, make sure you do not include unnecessary elements. Use a clear language in messaging and on labels. Improve consistency and apply common UI elements As you create your android ui design, have consistency and use common UI elements. Using common UI elements makes your end user feel comfortable and do things fast. To improve efficiency, you should also create patterns, layout and design throughout the design. Use texture and color strategically During the designing process, give attention or redirect focus off items by use of light, color, texture and texture to your advantage. Apply typography Use typography to create clarity and hierarchy. Take time to think how you should use typeface. Use different arrangements of text, fonts and sizes to enhance legibility, readability and scanability. Let the system communicate what is happening Make sure that your android UI informs your users of location changes in state, action or errors. Apply several UI elements to communicate about status to help in reducing frustrations to your end user. As you do the design, you should also think about defaults and be very purposeful in your page layout.
